

## LAB 21 - MOVIE REGISTRATION

**Task:** Create a Movie Registration Form.

### What does the application do?

1. Create a Movie model with the following properties:
  - ID
  - Title
  - Genre
  - Year
  - Actors
  - Directors
2. The Index View should have an action link pointing to the registration page.
3. The registration page will have a form for registering a new Movie. The form should take in fields for each property in the Movie model.
4. When submitted, the page should redirect the user to a summary on a result page. Using the Movie model from the previous page, display a message: movie.Title + " has been registered"

**Hint:** Explore the input and form tags in HTML for the movie registration. Thanks to HTML5 those inputs are powerful and very flexible

### Build Specifications

1. Create the Registration form in HTML, then call an action to handle the input. Experiment with method="GET" and method="POST" to send the information from the form. Which do you think is more secure? Is there any sensitive data left out in the open?
